On October 9th 2012, educators Sarah McGuire and Jaclyn Miller, from the Chesapeake Bay National Estuarine Research Reserve in VA, visited all of Mr. Ligon’s 7th grade science classes to instruct the students about the Chesapeake Bay watershed and some of its inhabitants! Students rotated through different activities spending time investigating fish of the Chesapeake Bay and running demonstrations to help better understand the importance of wetlands.

Students used guides and reference books to identify fish of the Chesapeake Bay. Students were able to describe the fish’s lifestyle based on different adaptations viewed.
Students used demonstrations to represent the importance of wetlands. Students learned that wetlands help trap sediments and absorb water.

THANKS FOR A GREAT DAY. SEE YOU IN THE SPRING!
